

Circuit Rescue | Build a steady-hand game

Operation-style game for regular CIRC class. Two 35-minute visits. The game buzzes when the metal probe touches a foil edge. It never shocks anyone.

Parts for one team

One switched covered 2 x AA battery holder; two AA cells; one active DC buzzer explicitly rated by its maker to run at 3 V; insulated alligator leads; a blunt metal probe with insulated grip; cardboard lid; foil; tape; large foam/card tokens. Teacher prepares openings and covers sharp edges.

Simple series circuit

Battery + -> buzzer +

Buzzer - -> foil rim

Metal probe -> battery -

Touching the probe to the rim closes the circuit. Away from the rim, the circuit is open.

Teacher check before students play

Use the component maker's marked polarity and voltage. Secure batteries inside their covered holder. Power off while changing connections. Keep the buzzer in series; never connect the battery terminals directly. Pilot one station. If a part or battery warms, stop and disconnect it. No mains power, chargers, bare sharp wire or person as part of the circuit.

Visit 1	Minutes
Goal and demonstrate open/closed circuit	0-5
Predict which contacts will sound; explain the path	5-9
Design cardboard game and safe foil-edged openings	9-23
Teacher checks wiring; try three contacts and three noncontacts	23-30
Save the game, switch off, reset and explain	30-35

No working components yet? Build the cardboard game and circuit diagram. A partner says "buzz" only when the probe touches the edge. Mark this as a model, not an electrical test.

Circuit Rescue | Test, improve, explain

Visit 2	Minutes
Retrieve, inspect and teacher-check the station	0-5
Run three equal trials with the same token and opening	5-15
Change one feature: opening size, probe grip or token	15-23
Repeat three trials under the same rule	23-29
Share evidence, power off, count tools and reset	29-35

Our test record

Version / one change	Trial 1 touches	Trial 2 touches	Trial 3 touches
First design	_____	_____	_____
Changed design	_____	_____	_____

Our fair-test rule: _____

We changed: _____

Our evidence says: _____

We would keep / undo this change because: _____

Access and extension

Use bigger openings and tokens, a steady base and a supported grip. Let one partner move while another records, then switch or choose another meaningful role. A matched light module can replace sound after teacher review; do not put an unprotected LED straight across a battery.

Why it works

The probe and foil behave like a switch. Contact completes a path through the buzzer. The buzzer signals the touch; there is no shock feature.

Circuit background: Science Buddies, 18 Science Lessons to Teach Circuits: <https://www.sciencebuddies.org/blog/circuits-lessons>. This is an original classroom adaptation, not a product wiring certification. Follow the chosen components' instructions.

Your next Canva lesson | 35 minutes

Personal-interest logo from a template. NeuroArt is finished; this is the next normal lesson. Show: "I can change a template to communicate one interest and make it readable when small."

Time	Say / do
0-4	Devices out. Open resources.svsd.net and school Canva.
4-8	Show two logos small. Ask what makes each easy to recognize. Model changing one icon, one font and two colors.
8-22	Choose a logo template. Change its colors, icon and font. Add a slogan of six words or fewer.
22-25	Zoom out to stamp size. Ask a partner what they can read. Fix one thing.
25-29	Share with your CIRC teacher's school account. The teacher opens it to confirm receipt. Keep public sharing unchanged.
29-35	Name one change you made. Save, close, return, plug in and count devices.

Done today

A shared logo that communicates an interest, includes a short slogan and reads when small. Paper and pencil with the same criteria is the complete fallback. Nobody needs to share private information.

Next meeting

Start from a blank Canva design. Make an original logo; get kind, specific feedback; explain two choices; share and verify. The current year guide contains both full visits.

NeuroArt | Finish check and preview

Use only for a student or class with missing work. This is not an added full-class unit; Kenny confirmed the NeuroArt rotation is finished.

Five-minute finish check

1. Open the actual saved picture or find the paper artwork.
2. Show one rounded crossing and a deliberate color choice.
3. Fix one unfinished corner or accidental color spill, if needed.
4. Save in the existing school location; reopen it. Keep the original.
5. Explain one choice by speaking, pointing or writing.

What students can say

"I rounded this corner so ____."

"I used these colors because ____."

"The change I made was ____."

Preview the next lesson

Show a large logo, then make it small. Ask: "What survives when this gets tiny?" Connect NeuroArt choices about lines and color to clear logo choices. Then use the Canva visit on the previous page.

Teacher recording storyboard, if you want a preview clip

0-10 seconds: show the saved artwork and say the goal.

10-30 seconds: zoom in on one corner and round it.

30-45 seconds: show one color change.

45-60 seconds: save, reopen and show the finished check.

60-75 seconds: show the logo preview and the three criteria: interest, slogan, reads small.

This is a ready-to-record script. No classroom recording, student artwork or voice recording has been created or uploaded by this packet.
